Note : Within nine months from the publication of the mention of the grant of the European patent, any person may give notice to the European Patent Office of opposition to the European patent granted. Notice of opposition shall be filed in a written reasoned statement. It shall not be deemed to have been filed until the opposition fee has been paid (Art. 99(1) European patent convention).

Description

The present invention is concerned with ultraviolet sensitive photoinitiator composition. The compositions of the present invention are especially useful for promoting cationic polymerizations. In particular, the compositions of the present invention find particular applicability in the formation of patterns of photoresists employing imagewise exposure with ultraviolet light. The compositions of the present invention exhibit increased photospeed. Also the photoinitiator compositions of the present invention are useful for initiating the polymerization of a wide variety of cationic polymerizable monomers and polymers.

Various compounds have been suggested as photoinitiators for photochemically induced cationic polymerizations of such materials as epoxy resins, cyclic ethers, cyclic esters, such as cyclic formals and cyclic acetals, polyvinyl acetals, phenoplasts, aminoplasts, lactones and silicones.

Along these lines, see U.S. Patent 4, 161,478, "A Novel Photoinitiator of Cationic Polymerization: Preparation and Characterization of Bis[4-(diphenylsulfonio)phenyl]sulfide-Bis-Hexafluorophosphate", Journal of Polymer Science: Polymer Chemistry Edition, Vol. 22, p. 1789, 1980 John Wiley & Sons, Inc.

Certain sulfonium and iodonium salts have been suggested as the initiators for such cationic polymerizations. Additional discussions concerning these previously suggested sulfonium and iodonium salts can be found, for instance, in Pappas, et al., "Photoinitiation of Cationic Polymerization. III. Photosensitization of Diphenyliodonium and Triphenylsulfonium Salts", Journal of Polymer Science: Polymer Chemistry Edition, Vol. 22, pp. 77-84, 1984 John Wiley & Sons, Inc.; Crivello, et al., "Photoinitiated Cationic Polymerization with Triarylsulfonium Salts", Journal of Polymer Science: Polymer Chemistry Edition, Vol. 17, pp. 977-999, 1979 John Wiley & Sons, Inc.; Crivello, et al., "Complex Triarylsulfonium Salt Photoinitiators. I. The Identification, Characterization, and Syntheses of a New Class of Triarylsulfonium Salt Photoinitiators", Journal of Polymer Science: Polymer Chemistry Edition, Vol. 18, pp. 2677-2695, 1980 John Wiley & Sons, Inc.; and Crivello, "Cationic Polymerization - Iodonium and Sulfonium Salt Photoinitiators", Advances in Polymer Science, Series #62, pp. 1-48.

Various photoinitiators are also discussed in U.S. patents 4,175,972; 4,442,197; 4,139,655; 4,400,541; 4,197,174; 4,173,476; 4,069,055 and 4,299,938 and European patent applications 84/0094914 and 84/0126712.

Although various of the prior art onium salts are very efficient photoinitiators for a wide range of cationic polymerizable materials, such suffer from the deficiency that ultraviolet light absorption in the 300-400 nanometer range is lacking. This range, however, represents an important range given off by mercury lamps. In order to render these onium salts usable in such ranges, it is necessary to add a photosensitizer that absorbs light in the 300-400 nanometer range to the onium salt. Examples of previously suggested photosensitizers are perylene, anthracene and various alkyl derivatives of anthracene.

Although these materials have been effective as photosensitizers, their use has been restricted because such are either insoluble or exhibit only very limited solubility in common organic solvent. This problem of solubility precludes use of these photosensitizers in thin films (e.g. thickness < 10 microns) applications.

The present invention provides for ultraviolet sensitive photoinitiator compositions that include photosensitizers which are not only extremely effective, but also exhibit high solubility in a variety of common organic solvents.

In particular, the present invention is concerned with light sensitive photoinitiator compositions that are especially suitable for cationic polymerizations. The compositions of the present invention contain:

at least one anthracene derivative represented by the formula:

wherein X is $\text{CH}=\text{CH}_2$ or

with R being selected from the group of H,

10 and n is an integer of 1 to 2;
wherein each R^I, R^{II} and R^{III} individually is selected from the group of alkyl, alkenyl, aryl,

wherein each R^{IV}, R^V and R^{VI} individually is selected from the group of alkyl, alkenyl and aryl; and
wherein m is an integer of 0 to 4 and p is an integer of 0 to 4;
B) an onium salt; and
25 C) an organic solvent wherein the weight ratio of A:B is about 1:2 to about 1:10.
In addition, the present invention is concerned with ultraviolet light sensitive compositions which contain:
A) a cationically polymerizable material;
B) an onium salt in an amount sufficient to cause polymerization of the cationically polymerizable material;
and
30 C) an anthracene derivative represented by the formula:

40 wherein X is CH=CH₂ or -(CH₂)_n-O-(-R) with R being selected from the group of H,

50 wherein m, R^I, R^{II} and R^{III} have the same meanings defined above, and n is an integer of 1 to 2; and wherein the weight ratio of B:C is about 1:2 to about 1:10.

The present invention is also concerned with forming a pattern of a photoresist. The process includes providing on a substrate an uncured film of:

- 55
- 1) a cationic polymerizable material;
 - 2) an onium salt in an amount sufficient to cause polymerization of the cationic polymerizable material;
 - and
 - 3) an anthracene derivative represented by the formula:

wherein X is CH=CH₂ or -(CH₂)_n O-(R) with R being selected from the group of H,

wherein m, R^I, R^{II} and R^{III} have the same meanings defined above, and n is an integer of 1 to 2; and wherein the weight ratio of components 2: and 3 is about 1:2 to about 1:10

The uncured film is imagewise exposed to ultraviolet light in a pattern to thereby cause cationic polymerization of the film in the exposed pattern. The photoresist is then developed by removing the unexposed portion of the film.

Examples of radiation sensitive epoxy functionalized organosilicon glass resins are represented by the following formulae II and III:

and

III.

Each R¹, R², R³, R⁴, R⁵, R⁶, R⁷, R⁸, R⁹, R¹⁰, R¹¹ and R¹² in the above formulae II and III are well-known and are typified by radicals usually associated with silicon-bonded organic groups and silicon-bonded hydrogen groups. Each R¹, R², R³, R⁴, R⁵, R⁶, R⁷, R⁸, R⁹, R¹⁰, R¹¹, and R¹² radical in the above formulae II and III is individually selected from the group of hydrogen, monovalent hydrocarbon radicals, epoxy groups, mercapto radical, and cyanoalkyl radicals.

Each a is an integer from 0 to 12 and preferably 0-3. Z is an integer from 1 to 10^2 and preferably about 10 to about 20. Each x is an integer from 0 to 2.

25 In addition, the present invention is concerned with forming a pattern of a photoresist from the above organosilicon compounds of formulae II and III. The process includes providing on a substrate an uncured film of an organosilicon material of formula II or III. Imagewise exposing the film to radiation such as electron-beam radiation to thereby cause polymerization of the film in the exposed pattern. The photoresist is then developed by removing the unexposed portion of the film.

In accordance with the present invention, certain anthracene derivatives are employed in ultraviolet light sensitive photoinitiator compositions. These anthracene derivatives act to sensitize the compositions to ultraviolet light in the 300-400 nanometer range. In addition, the specific anthracene derivatives required by the present invention are readily soluble in a wide variety of common organic solvents. It is critical to the success of the present invention that the anthracene derivative employed be one or more compounds represented by the formula:

45 wherein X is $\text{CH}=\text{CH}_2$ or $-(\text{CH}_2)_n\text{O}-(\text{R})$ with R being H or

n being an integer of 1 to 2, and preferably 1 to 0; m being an integer of 0 to 4 and preferably 0; and wherein Rⁱ, Rⁱⁱ and Rⁱⁱⁱ individually is selected from the group of alkyl, alkenyl, aryl,

and

wherein each R^{IV} , R^{V} and R^{VI} individually is selected from the group of alkyl, alkenyl and aryl and wherein p is an integer of 0 to 4 and preferably one. Preferably each R^{I} , R^{II} and R^{III} is an alkyl group and most preferably is methyl.

Examples of suitable alkyl groups contain 1 to 6 carbon atoms and include methyl, ethyl, propyl, butyl and pentyl.

Examples of alkenyl groups contain 2-6 carbon atoms and include ethylene, propylene, and butylene.

Examples of aryl groups contain 6 to 14 carbon atoms and include phenyl, naphthyl and anthracyl.

Specific anthracene derivatives suitable for use in the present invention are:

9 - anthracene methanol;

9 - vinyl anthracene and the trimethylsiloxy ether of 9 - anthracene methanol.

The ultraviolet light sensitive photoinitiator compositions of the present invention also contain a radiation sensitive onium salt.

Examples of suitable onium salts include aromatic onium salts of Group VI elements discussed in U.S. Patent 4,175,972, disclosure of which is incorporated herein by reference, and aromatic onium salts of Group Va elements discussed in U.S. Patent 4,069,055, disclosure of which is incorporated herein by reference.

Aromatic Group VIa onium salts include those represented by the formula:

where R is a monovalent aromatic organic radical, R^1 is a monovalent organic aliphatic radical selected from alkyl, cycloalkyl and substituted alkyl, R^2 is a polyvalent organic radical forming a heterocyclic or fused ring structure selected from aliphatic radicals and aromatic radicals, X is a Group VIa element selected from sulfur, selenium, and tellurium, M is a metal or metalloid, Q is a halogen radical, a is a whole number equal to 0 to 3 inclusive, b is a whole number equal to 0 to 2 inclusive, c is a whole number equal to 0 or 1, where the sum of $a+b+c$ is a value equal to 3 or the valence of X ,

$$d=e-f$$

f =valence of M and is an integer equal to from 2 to 7 inclusive, e is $>f$ and is an integer having a value up to 8.

Radicals included by R are, for example, $\text{C}_{(6-14)}$ aromatic hydrocarbon radicals such as phenyl, tolyl, naphthyl, anthryl, and such radicals substituted with up to 1 to 4 monovalent radicals such as $\text{C}_{(1-8)}$ alkoxy, $\text{C}_{(1-8)}$ alkyl, nitro, chloro, and hydroxy; arylacyl radicals such as benzyl and phenylacyl; aromatic heterocyclic radicals such as pyridyl and furfuryl. R^1 radicals include $\text{C}_{(1-8)}$ alkyl such as methyl and ethyl, substituted alkyl such as $-\text{C}_2\text{H}_4\text{OCH}_3$, $-\text{CH}_2\text{COOC}_2\text{H}_5$, $-\text{CH}_2\text{COCH}_3$, etc. R^2 radicals include such structures as:

5

10

15

Complex anions included by $MQ_n^{-(n-1)}$ of Formula I are, for example, BF_4^- , PF_6^- , SbF_6^- , $FeCl_4^-$, $SnCl_6^{2-}$, $SbCl_6^-$, $BiCl_6^-$, AlF_6^{3-} , $GaCl_4^-$, InF_4^- , TiF_6^- , ZrF_6^- , etc., where M is a metal such as Sb, Fe, Sn, Bi, Al, Ga, In, Ti, Zr, Sc, V, Cr, Mn, Cs, rare earth elements such as the lanthanides, for example, Ce, Pr, Nd, etc., actinides, such as Th, Pa, U, Np, etc. and metalloids such as B, P, and As.

20

Group VIA onium salts included by Formula I are, for example:

25

 BF_4^-

30

 PF_6^-

35

 AsF_6^-

40

 SbF_6^-

45

 $FeCl_4^-$

50

 $SnCl_6^{2-}$

55

5

 SbF_6^-

10

15

 BiCl_3^-

20

25

 BF_4^-

30

35

 PF_6^-

40

Aromatic group Va onium salts include those represented by the formula:

45

50 where R is a monovalent aromatic organic radical selected from carbocyclic radicals and heterocyclic radicals, R¹ is a monovalent organic aliphatic radical selected from alkyl, alkoxy, cycloalkyl and substituted derivatives thereof, R² is a polyvalent organic radical forming an aromatic heterocyclic or fused ring structure with X¹, X¹ is a Group Va element selected from N, P, As, Sb, and Bi, M is a metal or metalloid, Q is a halogen radical, a is a whole number equal to 0 to 4 inclusive, b is a whole number equal to 0 to 2 inclusive, c is a whole number equal to 0 to 2 inclusive, and the sum of a+b+c is a value equal to 4 or the valence of X¹,

55

$$d=e-f$$

f=valence of M and is an integer equal to from 2 to 7 inclusive, e is >f and is an integer having a value up to 8.

Radicals included by R are, for example, $C_{(6-14)}$ aromatic hydrocarbon radicals such as phenyl, tolyl, naphthyl, anthryl and such radicals substituted with up to 1 to 4 monovalent radicals such as $C_{(1-8)}$ alkoxy, $C_{(1-8)}$ alkyl, nitro, chloro, and hydroxy; arylacyl radicals such as phenylacyl; arylalkyl radicals such as phenyl ethyl; aromatic heterocyclic radicals such as pyridyl and furfuryl; R^1 radicals include $C_{(1-8)}$ alkyl, $C_{(3-8)}$ cycloalkyl, substituted alkyl such as haloalkyl, for example, chloroethyl; alkoxy such as $OCH_2C_6H_5$ and OCH_3 ; alkoxyalkyl such as $C_3H_7OCH_2$; alkylacyl such as $-CH_2COOC_2H_5$; ketoalkyl such as $-CH_2COCH_3$.

Radicals included by R^2 are, for example:

where Q' is selected from O, CH_2 , N, R, and S; Z is selected from -O-, -S- and

and R' is a monovalent radical selected from hydrogen and hydrocarbon. Complex anions included by $MQ_n^{-(n-1)}$ are, for example, BF_4^- , PF_6^- , AsF_6^- , $FeCl_4^-$, $SnCl_6^{2-}$, $SbCl_6^-$, $BiCl_6^-$, where M is more particularly a transition metal such as Sb, Fe, Sn, Bi, Al, Ga, In, Ti, Zr, Sc, V, Cr, Mn, and Co; rare earth elements such as the lanthanides, for example, Ce, Pr, and Nd; actinides such as Th, Pa, U, and Np; and metalloids such as B, P, and As.

Anions which are slightly hydrolyzed, e.g. SbF_6OH^- are considered to be the full equivalent of the unhydrolyzed form of the anion for the purposes of the present invention.

The weight ratio of the anthracene derivative to the onium salt is usually about 1:2 to about 1:10 and preferably about 1:4 to about 1:5.

In addition, the photoinitiator compositions usually include an organic solvent in order to facilitate a mixture of the components of the above compositions with a polymerizable composition for use of the initiator.

Suitable organic solvents include monohydric saturated aliphatic alcohols such as methanol; ethanol, n-propanol, iso-propanol and n-butanol, aromatic hydrocarbons such as benzene, toluene and xylene; propylene glycol monomethyl ether, propylene glycol monomethyl ether acetate, 2 methoxy ethanol and 2 methoxy ethyl-ether.

The organic solvents are usually employed in amounts of about 30% to about 90% and preferably about 60% to about 75% based upon the total weight of all of the components.

The light sensitive compositions of the present invention are useful as photoinitiators for cationic polymerizations such as polymerizations of epoxy polymers, phenoplast, aminoplast, polyvinylacetals, lactones, cyclic ethers, and cyclic esters such as cyclic acetates and cyclic formals, and silicones.

Typical examples of epoxy polymers include the epoxidized novolak polymers and the polyepoxides from halo-epoxy alkanes such as epichlorohydrin and a polynuclear dihydric phenol such as bisphenol A. Mixtures

of epoxides can be used when desired.

The epoxidized novolak polymers are commercially available and can be prepared by known methods by the reaction of a thermoplastic phenolic aldehyde of a phenol with a halo-epoxy alkane. The phenol can be a mononuclear or polynuclear phenol. Examples of mononuclear phenols have the formula:

5

10

15

wherein X, Y, and R_5 are hydrocarbons containing no more than about 12 carbon atoms.

Hydrocarbon-substituted phenols having two available positions ortho or para to a phenolic hydroxy group for aldehyde condensation to provide polymers suitable for the preparation of epoxy novolaks include o- and p-cresols, o- and p-ethyl phenols, o- and p-isopropyl phenols, o- and p-tert-butyl phenols, o- and p-secbutyl phenols, o- and p-amyl phenols, o- and p-octyl phenols, o- and p-nonyl phenols, 2,5-xyleneol, 3,4-xyleneol, 2,5-diethyl phenol, 3,4-diethyl xyleneol, 2,5-diisopropyl phenol, 4-methyl resorcinol, 4-ethyl resorcinol, 4-isopropyl resorcinol, 4-tert-butyl resorcinol, o- and p-benzyl phenol, o- and p-phenethyl phenols, o- and p-phenyl phenols, o- and p-tolyl phenols, o- and p-xylyl phenols, o- and p-cyclohexyl phenols, o- and p-cyclopentyl phenols, 4-phenethyl resorcinol, 4-tolyl resorcinol, and 4-cyclohexyl resorcinol.

Various chloro-substituted phenols which can also be used in the preparation of phenol-aldehyde resins suitable for the preparation of the epoxy novolaks include o- and p-chloro-phenols, 2,5-dichloro-phenol, 2,3-dichloro-phenol, 3,4-dichloro-phenol, 2-chloro-3-methyl-phenol 2-chloro-5-methyl-phenol, 3-chloro-2-methyl-phenol, 5-chloro-2-methyl-phenol, 3-chloro-4-methyl-phenol, 4-chloro-3-methyl-phenol, 4-chloro-3-ethyl-phenol, 4-chloro-3-isopropyl-phenol, 3-chloro-4-phenyl-phenol, 3-chloro-4-chloro-phenyl-phenol, 3,5-dichloro-4-methyl-phenol, 3,5-dichloro-5-methyl-phenol, 3,5-dichloro-2-methyl-phenol, 2,3-dichloro-5-methyl-phenol, 2,5-dichloro-3-methyl-phenol, 3-chloro-4,5-dimethyl-phenol, 4-chloro-3,4-dimethyl-phenol, 2-chloro-3,5-dimethyl-phenol, 5-chloro-2,3-dimethyl-phenol, 5-chloro-3,5-dimethyl-phenol, 2,3,5-trichloro-phenol, 3,4,5-trichloro-phenol, 4-chloro-resorcinol, 4,5-dichloro-resorcinol, 4-chloro-5-methyl-resorcinol, 5-chloro-4-methyl-resorcinol.

Typical phenols which have more than two positions ortho or para to a phenolic hydroxy group available for aldehyde condensation and which, by controlled aldehyde condensation, can also be used are: phenol, m-cresol, 3,5-xyleneol, m-ethyl and m-isopropyl phenols, m,m'-diethyl and diisopropyl phenols, m-butyl-phenols, m-amyl phenols, m-octyl phenols, m-nonyl phenols, resorcinol, 5-methyl-resorcinol, 5-ethyl resorcinol. Examples of polynuclear dihydroxy phenols are those having the formula:

40

45

50

wherein Ar is an aromatic divalent hydrocarbon such as naphthylene and, preferably, phenylene; A and A_1 which can be the same or different are alkyl radicals, preferably having from 1 to 4 carbon atoms, halogen atoms, i.e., fluorine, chlorine, bromine, and iodine, or alkoxy radicals, preferably having from 1 to 4 carbon atoms; x and y are integers having a value 0 to a maximum value corresponding to the number of hydrogen atoms on the aromatic radical (Ar) which can be replaced by substituents and R_6 is a bond between adjacent carbon atoms as in dihydroxydiphenyl or is a divalent radical including, for example:

55

-O-, -S-, -SO-, -SO₂-, and -S-S-

and divalent hydrocarbon radicals, such as alkylene, alkylidene, cycloaliphatic, e.g., cycloalkylene and cycloalkylidene, halogenated, alkoxy or aryloxy substituted alkylene, alkylidene and cycloaliphatic radicals, as well as alkarylene and aromatic radicals including halogenated, alkyl, alkoxy or aryloxy substituted aromatic radicals and a ring fused to an Ar group; or R⁶ can be polyalkoxy, or polysiloxy, or two or more alkylidene radicals separated by an aromatic ring, a tertiary amino group, an ether linkage, a carbonyl group or a sulfur containing group such as sulfoxide, and the like.

Examples of specific dihydroxy polynuclear phenols include, among others, the bis-(hydroxyphenyl)alkanes such as 2,2'-bis-(4-hydroxyphenyl)propane, 2,4'-dihydroxydiphenylmethane, bis-(2-hydroxyphenyl)methane, bis-(4-hydroxyphenyl)methane, bis-(4-hydroxy-2,6-dimethyl-3-methoxyphenyl)methane, 1,1'-bis-(4-hydroxyphenyl)ethane, 1,2'-bis-(4-hydroxyphenyl)ethane, 1,1'-bis-(4-hydroxy-2-chlorophenyl)ethane, 1,1'-bis-(3-methyl-4-hydroxyphenyl)ethane, 1,3'-bis-(3-methyl-4-hydroxyphenyl)propane, 2,2'-bis-(3-phenyl-4-hydroxyphenyl)propane, 2,2'-bis-(3-isopropyl-4-hydroxyphenyl)propane, 2,2'-bis-(2-isopropyl-4-hydroxyphenyl)pentane, 2,2'-bis-(4-hydroxyphenyl)heptane, bis-(4-hydroxyphenyl)phenylmethane, bis-(4-hydroxyphenyl)cyclohexylmethane, 1,2'-bis-(4-hydroxyphenyl)-1,2'-bis-(phenyl)propane and 2,2'-bis-(4-hydroxyphenyl)-1-phenylpropane; di(hydroxyphenyl)sulfones such as bis-(4-hydroxyphenyl)sulfone, 2,4'-dihydroxydiphenylsulfone, 5'-chloro-2,4'-dihydroxydiphenyl sulfone, and 5'-chloro-4,4'-dihydroxydiphenylsulfone; di(hydroxyphenyl)ethers such as bis-(4-hydroxyphenyl)ether, the 4,4'-, 4,2'-, 2,2'-, 2,3'-, dihydroxydiphenyl ethers, 4,4'-dihydroxy-2,6-dimethyldiphenyl ether, bis-(4-hydroxy-3-isobutylphenyl)ether, bis-(4-hydroxy-3-isopropylphenyl)ether, bis-(4-hydroxy-3-chlorophenyl)ether, bis-(4-hydroxy-3-fluorophenyl) ether, bis-(4-hydroxy-3-bromophenyl)ether, bis-(4-hydroxy-naphthyl)ether, bis-(4-hydroxy-3-chloronaphthyl) ether, bis-(2-hydroxydiphenyl)ether, 4,4'-dihydroxy-2,6-dimethoxydiphenyl ether, and 4,4'-dihydroxy-2,5-diethoxydiphenyl ether.

The preferred dihydric polynuclear phenols are represented by the formula:

wherein A and A₁ are as previously defined, x and y have values from 0 to 4 inclusive and R₆ is a divalent saturated aliphatic hydrocarbon radical, particularly alkylene and alkylidene radicals having from 1 to 3 carbon atoms, and cycloalkylene radicals having up to and including 10 carbon atoms. The most preferred dihydric phenol is bisphenol A, i.e., 2,2'-bis(p-hydroxyphenyl)propane.

As condensing agents, any aldehyde may be used which will condense with the particular phenol being used, including formaldehyde, acetaldehyde, propionaldehyde, butyraldehyde, heptaldehyde, cyclohexanone, methyl cyclohexanone, cyclopentanone, benzaldehyde, and nuclear alkyl-substituted benzaldehydes, such as toluic aldehyde, naphthaldehyde, furfuraldehyde, glyoxal, acrolein, or compounds capable of engendering aldehydes such as para-formaldehyde, hexamethylene tetramine.

The aldehydes can also be used in the form of a solution, such as the commercially available formalin. The preferred aldehyde is formaldehyde.

The halo-epoxy alkane can be represented by the formula:

wherein X is a halogen atom (e.g., chlorine, bromine, and the like), p is an integer from 1-8, each R₂ individually is hydrogen or alkyl group of up to 7 carbon atoms; wherein the number of carbon atoms in any epoxy alkyl group totals no more than 10 carbon atoms.

While glycidyl ethers, such as derived from epichlorohydrin, are particularly preferred in the practice of this invention, the epoxy polymers containing epoxyalkoxy groups of a greater number of carbon atoms are also suitable. These are prepared by substituting for epichlorohydrin such representative corresponding chlorides or bromides of monohydroxy epoxyalkanes as 1-chloro-2,3-epoxybutane, 1-chloro-3,4-epoxybutane, 2-chloro-3,4-epoxybutane, 1-chloro-2-methyl-2,3-epoxypropane, 1-bromo-2,3-epoxypentane, 2-chloromethyl-1,2-epoxybutane, 1-bromo-4-methyl-3,4-epoxypentane, 1-bromo-4-ethyl-2,3-epoxypentane, 4-chloro-2-methyl-2,3-epoxypentane, 1-chloro-2,3-epoxyoctane, 1-chloro-2-methyl-2,3-epoxyoctane, or 1-chloro-2,3-epoxydecane. Although it is possible to use haloepoxyalkanes having a greater number of carbon atoms than indicated above, there is generally no advantage in using those having a total of more than 10 carbon atoms.

In addition, the polyepoxides of halo epoxy alkane of the type discussed above and a polynuclear dihydric phenol of the type above can be employed. The preferred polyepoxides of this class being the polyepoxides of epichlorohydrin and bisphenol A, i.e., 2,2-bis(p-hydroxyphenyl)propane.

The initiator compositions of the present invention are especially suitable in polymerizations of organosilicon resins and most particularly the polysilsesquioxane prepolymers such as those having terminal hydroxyl groups. Examples of such can be represented by the structural formula:

I.

Each R and R¹ in the above formula are well-known and are typified by radicals usually associated with silicon-bonded organic groups and silicon-bonded hydroxyl groups. Each R and R₁ radical in the above formula is individually selected from the group of hydrogen, monovalent hydrocarbon radicals, halogenated monovalent hydrocarbon radicals, epoxy groups, mercapto radicals, and cyanoalkyl radicals. Thus, the radicals R and R¹ may be alkyl, such as methyl, ethyl, propyl, butyl, and octyl; aryl radicals such as phenyl, tolyl, xylyl, and naphthyl radicals, aralkyl radicals such as benzyl, and phenylethyl radicals; olefinically unsaturated monovalent hydrocarbon radicals such as vinyl, allyl, cyclohexenyl radicals; cycloalkyl radicals such as cyclohexyl, cyclohep-

tyl; halogenated monovalent hydrocarbon radicals such as dichloropropyl, 1,1,1-trifluoropropyl, chlorophenyl, dibromophenyl, and chloromethyl; cyanoalkyl radicals such as cyanoethyl, and cyanopropyl. Preferably, the radicals represented by R and R¹ have less than eight carbon atoms and in particular it is preferred that R and R¹ be methyl, ethyl, or phenyl.

Especially preferred organosilicon polymers are certain epoxy-functional organosilicon glass resins. Such have high glass transition temperatures, high contrast and sensitivity and increased resistance to oxygen reactive ion etching.

Examples of such can be represented by the structural formulae II and III:

II.

and

III.

Each R¹, R², R³, R⁴, R⁵, R⁶, R⁷, R⁸, R⁹, R¹⁰, R¹¹ and R¹² in the above formulae II and III are well-known and are typified by radicals usually associated with silicon-bonded organic groups and silicon-bonded hydrogen groups. Each R¹, R², R³, R⁴, R⁵, R⁶, R⁷, R⁸, R⁹, R¹⁰, R¹¹, and R¹² radical in the above formulae II and III is individually selected from the group of hydrogen, monovalent hydrocarbon radicals, epoxy groups, mercapto radical, and cyanoalkyl radicals. Thus, the radicals R¹ through R¹² may be alkyl, such as methyl, ethyl, propyl, butyl, and octyl; aryl radicals such as phenyl, tolyl, xylyl, and naphthyl radicals, aralkyl radicals such as benzyl, and phenylethyl radicals; olefinically unsaturated monovalent hydrocarbon radicals such as vinyl, allyl, cyclohexenyl radicals; cycloalkyl radicals such as cyclohexyl, cycloheptyl; halogenated monovalent hydrocarbon radicals such as dichloropropyl, 1,1,1-trifluoropropyl, chlorophenyl, dibromophenyl, and chloromethyl; cyanoalkyl radicals such as cyanoethyl, and cyanopropyl. Preferably, the radicals represented by R¹ through R¹² have less than eight carbon atoms and in particular it is preferred that R¹ through R¹² be methyl, ethyl, or phenyl.

Each a is an integer from 0 to 12 and preferably 0-3. Z is an integer from 1 to 10² and preferably about 10 to about 20. Each x is an integer from 0 to 2.

The epoxy containing organosilicon glass resins represented by formula II above can be prepared by reacting H₂O-Si-terminated glass resins (IIb) with an excess of glycidio containing mono- or polyfunctional alkoxy silicon compounds (IIa) in solutions (~20% of solids, diglyme, for example) for about 17-24 hours at 70°C or

for 3 hours at 120°C.

(IIa)

and

(IIb)

The epoxy containing glass resins represented by formula III above can be prepared by reacting mono-functional chlorosilanes such as [2-(3-cyclohexenyl)ethyl]dimethylchlorosilane (IIa) with HO-terminated glass resins (IIb) in the presence of HCl acceptors (such as alkali metal carbonates including Na and K carbonates or organic trisubstituted amines including pyridine or triethyl amine) in excess of room temperature in ether solution (20%) according to the scheme:

The product (IIIb) from the above reaction is then epoxidized by reaction with 3-chloroperoxybenzoic acid. In cationic polymerizations, the onium salts are generally employed in amounts of about 0.5 to about 10% by weight and preferably about 4 to about 6% by weight based upon the material being polymerized.

The cationic polymerizable compositions can also include conventional additives such as filter, plasticizers, and diluents.

When used as a lithographic material, the compositions of the present invention are applied to a desired substrate to provide films, generally about 1 to about 25 microns, such as by spraying, spinning, dipping, or any other known means of application of coating. Some suitable substrates include those used in the fabrication of semiconductor devices or integrated circuits which include wafers or chips overcoated with oxides and nitrides (silicon oxide and/or silicon nitride for diffusion masks and passivation) and/or metals normally employed in the metallization steps for forming contacts and conductor patterns on the semiconductor chip.

In addition, the materials of the present invention can be used in conjunction with those substrates employed as chip carriers and including ceramic substrates and, especially, multilayer ceramic devices. Also included are dielectric substrates which can be thermoplastic and/or thermosetting polymers. Typical thermosetting polymeric materials include epoxy, phenolic-based materials, polyamides, and polyimides. The dielectric materials may be molded articles of the polymeric materials containing fillers and/or reinforcing agents such as glass-filled epoxy or phenolic-based materials. Examples of some phenolic-type materials include copolymers of phenol, resorcinol, and cresol. Examples of some suitable thermoplastic polymeric materials include polyolefins such as polypropylene; polysulfones; polycarbonates; nitrile rubber; and ABS polymers.

The compositions after being applied to the desired substrate are imagewise exposed to ultraviolet light radiation in the near UV range of about 300 to about 400 nanometers at dosages of about 20 to about 100 millijoules/cm². The compositions are then developed in a suitable solvent. Being negative resist materials,

that portion exposed to the ultraviolet light remains in place and provides the desired pattern.

According to another aspect of the present invention, the preferred epoxy functional silicones of the present invention as represented by formulae II and III hereinabove are sensitive to radiation in addition to the near ultraviolet light such as deep U.V. light, X-ray and preferably electron beam radiation. These materials when used as such are applied to a desired substrate to provide films generally about 1 to about 25 microns thick, such as by spraying, spinning, dipping, or any other known means of application of coating. Some suitable substrates includes those used in the fabrication of semiconductor devices or integrated circuits which include wafers or chips overcoated with oxides and nitrides (silicon oxide and/or silicon nitride for diffusion masks and passivation) and/or metals normally employed in the metallization steps for forming contacts and conductor patterns on the semiconductor chip.

In addition, the materials of the present invention can be used in conjunction with those substrates employed as chip carriers and including ceramic substrates and, especially, multilayer ceramic devices. Also included are dielectric substrates which can be thermoplastic and/or thermosetting polymers. Typical thermosetting polymeric materials include epoxy, phenolic-based materials, polyamides, and polyimides. The dielectric materials may be molded articles of the polymeric materials containing fillers and/or reinforcing agents such as glass-filled epoxy or phenolic-based materials. Examples of some phenolic-type materials include copolymers of phenol, resorcinol, and cresol. Examples of some suitable thermoplastic polymeric materials include polyolefins such as polypropylene; polysulfones; polycarbonates; nitrile rubber; and ABS polymers. These preferred silicones after being applied to the desired substrate are imagewise exposed to radiation and preferably electron beam radiation at dosages of about 2 to about 4 microcoulombs/cm² and energy levels of about 25 to about 50 kilowatts. The compositions are then developed in a suitable solvent. Being negative resist materials, that portion exposed to the radiation remains in place and provides the desired pattern.

The following non-limiting examples are presented to further illustrate the present invention:

Example 1

To a 30% solution of Quatrex 3450® in diglyme is added about 5% by weight of triphenyl sulphonium SbF₆ and about 2% by weight of anthracene methanol.

This solution is spun cast onto a silicon wafer and dried to provide a thickness of about 1 micron. At 26 millejoules/cm² dose exposed through a 365 nanometer narrow band filter, 100% of the exposed thickness of the resist remains upon contact with the diglyme solvent.

Comparison Example 2

Example 1 is repeated except the composition does not include anthracene methanol sensitizer. Even after 1000 millejoules/cm² expose dose though a 365 nanometer narrow band filter, none of the exposed thickness of the resist remains upon contact with the diglyme solvent.

Example 3

To a 30% solution of

wherein x is 1, in diglyme is added 5% by weight of triphenylsulphonium hexafluoroantimonate and 1.5% by

weight of anthracene methanol.

The solution is spun cast onto a silicon wafer and dried at about 90°C for about 5 minutes to provide a thickness of about 2 microns.

The pattern is exposed using ultraviolet light having wavelength of about 365 nanometer at a dosage of
5 about 20 millejoules/cm².

The part is then post baked at about 90 to about 100°C for about 5 minutes to cause further crosslinking of the exposed polymer. The patter is then developed in amyl acetate followed by air drying to leave the final image.

10 Example 4

An epoxy silicone is prepared by reacting

and

wherein m is 1 in the presence of an HCl acceptor.

Dissolve 100 grams of:

55 prepolymer (molecular weight = 552 grams/mole Hydroxyl weight = $\frac{552}{4} = 138 \frac{\text{grams}}{\text{mol.OH}}$) into at least 500 ml
of tetrahydrofuran containing 20% molar excess of triethylamine. ADD drop wise, 72 moles (145.8 grams) of

A white precipitate forms immediately. Vigorously stir solution for at least 24 hours. Filter off amine salt precipitate. Wash remaining solution with 1% HCl, 3 times - followed by aqueous sodium carbonate solution until pH of solution is 7-8. Dry over CaCl₂ or other suitable drying agents.

The product obtained is then epoxidized by reacting with 3-chloroperoxy benzoic acid in the following manner:
20 grams of

molecular weight = 1216 grams/mole predissolved in 180 mls of methylene chloride. Add dropwise to solution of 10 grams of 85% m-chloroperbenzoic acid dissolved in 100 mls of methylene chloride. The temperature is maintained at 10°C for 24 hours. A white precipitate slowly accumulates which is filtered off and discarded. The remaining solution is washed 1 time with 100 mls of 10% acetic acid, 3 time with 50 mls of deionized water and enough times with saturated sodium bicarbonate solution to achieve a neutral pH. The solution is then dried over a drying agent.

The polymer obtained can be represented by the following formula:

The above polymer is dissolved in diglyme to provide about a 25% by weight solution. To this solution are added about 5% by weight of triphenylsulfonium hexafluoroantimonate and about 2% by weight of 9-anthracene methanol. The solution is filtered to remove any undissolved solids and then coated onto a silicon wafer by spinning to provide a thickness of about 5 microns. The film is prebaked at about 90°C for about 5 minutes and exposed to ultraviolet light of wavelength of about 360 nanometers at a dosage of about 60 millejoules/cm². After exposure, the wafers were baked at about 90°C for about 3 minutes and developed in isoamyl acetate for about one minute followed by an isopropyl alcohol rinse. An image of very high resolution is obtained.

Also, the temperature stability of the organosilicon resist after exposure and development is extremely high. The patterns are heated to about 400°C for about 24 hours without any distortion resulting from the heating and with less than 10% thickness loss.

5 Example 5 - (Electron Beam Exposure)

A prepolymer having the same structure as employed in Example 4 is dissolved in diglyme to provide about a 25% by weight solution. The diglyme solution of the prepolymer is coated onto a silicon wafer spinning to provide a thickness of about 300 microns. The film is exposed to electron beam at 25 kilowatts at about 2-4 microcoulombs/cm². After exposure, the wafers are baked at about 90°C for about 3 minutes and developed in isoamyl acetate to provide about 0.5 micron lines of very high resolution.

Also, the temperature stability of the organosilicon resist after exposure and development is extremely high. The patterns are treated to about 400°C for about 24 hours without any distortion resulting from the heating and with less than 10% thickness loss.

15

Example 6 - (Electron Beam Exposure)

Example 5 is repeated except that the diglyme solution of the prepolymer is applied onto a silicon substrate already coated with a baked 1.2 micron layer of Shipley AZ photoresist. The developed organosilicon resist is used as a mask for an oxygen reactive ion etching of the AZ photoresist. Such provides for excellent resolution and allows for undercutting of the AZ layer without edge collapse of the relatively thin organosilicon layer.

20

Claims

25

1. Ultraviolet light sensitive photoinitiator composition suitable for cationic polymerization reactions which comprises:

A) at least one anthracene derivative represented by the formula:

30

35

wherein X is CH=CH₂ or -(CH₂)_n 0-(-R) with R being selected for group of H, and

40

45

wherein each R^I, R^{II} and R^{III} individually is selected from the group of alkyl, alkenyl aryl,

50

55

and

5

10

wherein each R^{IV} , R^V and R^{VI} individually is selected from the group of alkyl, alkenyl and aryl;
 wherein m is an integer of 0 to 4, p is an integer of 0 to 4; and n is an integer of 1 to 2;

15

B) an onium salt; and

C) an organic solvent wherein the weight ratio of A:B is about 1:2 to about 1:10.

2. Composition of claim 1 wherein said anthracene derivative is selected from the group of 9-anthracene methanol; 9-vinyl anthracene; and the trimethylsiloxy ether of 9-anthracene methanol.

20

3. Composition of claims 1 and 2 wherein said onium salt includes triphenyl sulfonium hexafluoroantimonate.

4. Composition of claim 3 wherein said onium salt is a 50/50 mixture of

25

30

35

5. Ultraviolet light sensitive composition comprising:

40

A) a cationically polymerizable material;

B) an onium salt in an amount sufficient to cause polymerization of the cationically polymerizable material; and

C) an anthracene derivative represented by the formula:

45

50

wherein X is $CH=CH_2$ or $-(-CH_2-)_n O-(-R)$ with R being selected from the group of H,

55

wherein each R^I, R^{II} and R^{III} individually is selected from the group of alkyl, alkenyl, aryl,

and

wherein each R^{IV}, R^V and R^{VI} individually is selected from the group of alkyl, alkenyl and aryl; wherein m is an integer of 0 to 4, p is an integer of 0 to 4; and n is an integer of 1 to 2; and wherein the weight of B:C is about 1:2 to about 1:10.

6. Composition of claim 5 wherein said anthracene derivative is selected from the group of 9-anthracene methanol; 9-vinyl anthracene; and the trimethylsiloxy ether of 9-anthracene methanol.
7. Composition of claims 5 and 6 wherein said onium salt includes triphenyl sulfonium hexafluoroantimonate.
8. Composition of claim 7 wherein said onium salt is a 50/50 mixture of

9. Composition of claim 5 wherein said cationically polymerizable material is an epoxy polymer or a silicone polymer.
10. Composition of claims 5 and 9 wherein said polymerizable silicone polymer is represented by the formula:

5

10

15

wherein x is 1 to 100.

11. Composition of claims 5 and 9 wherein said silicone polymer is represented by the formula:

20

25

30

35

12. Method for forming a pattern of a photoresist which comprises:

A) providing on a substrate an uncured film of

1) a cationic polymerizable material;

2) an onium salt in an amount sufficient to cause polymerization of said cationic polymerizable material; and

40

3) an anthracene derivative represented by the formula:

45

50

wherein X is $\text{CH}=\text{CH}_2$ or $-(\text{CH}_2)_n\text{O}-(\text{R})$ with R being selected from the group of H,

55

5

10

wherein each R^I, R^{II} and R^{III} individually is selected from the group of alkyl, alkenyl, aryl,

15

20

and

25

30

35

wherein each R^{IV}, R^V and R^{VI} individually is selected from the group of alkyl, alkenyl and aryl; wherein m is an integer of 0 to 4, p is an integer of 0 to 4; and n is an integer of 1 to 2; and wherein the weight ratio of 2:3 is about 1:2 to about 1:10;

B) imagewise exposing said uncured film to ultraviolet light in a pattern to thereby cause cationic polymerization of the film in said pattern; and

C) developing said photoresist.

40

13. Method of claim 12 wherein the wavelength of the ultraviolet light is about 300 to about 400 nanometers.

14. Method of claim 12 wherein said cationic polymerizable material is an epoxy or a silicone polymer.

45

15. Method of claim 12 wherein said radiation is electron-beam radiation.

Patentansprüche

50

1. Für ultraviolettes Licht empfindliche Photoinitiatorzusammensetzung, die für kationische Polymerisationsreaktionen geeignet ist und welches beinhaltet

A) wenigstens ein Anthracenderivat, das durch folgende Formel dargestellt wird

55

wobei X CH=CH₂ oder

10 -(CH₂)_n O-(-R) ist, wobei R gewählt wird aus einer Gruppe mit H, und

20 wobei jedes R^I, R^{II} und R^{III} individuell aus der Gruppe von Alkyl, Alkenyl, Aryl,

und

ausgewählt wird, wobei jedes R^{IV}, R^V und R^{VI} individuell aus der Gruppe von Alkyl, Alkenyl und Aryl ausgewählt wird;

45 wobei m eine ganze Zahl zwischen 0 und 4, p eine ganze Zahl zwischen 0 und 4; und n eine ganze Zahl zwischen 1 und 2 ist;

B) ein Oniumsalz; und

C) ein organisches Lösungsmittel, wobei das Gewichtsverhältnis von A:B etwa 1:2 bis etwa 1:10 beträgt.

50 2. Zusammensetzung nach Anspruch 1, wobei das Anthracenderivat aus der Gruppe mit 9-Anthracenmethanol; 9-Vinyanthracen; und dem Trimethylsiloxylether von 9-Anthracenmethanol ausgewählt wird.

3. Zusammensetzung nach den Ansprüchen 1 und 2, wobei das Oniumsalz Triphenylsulfoniumhexafluorantimonat beinhaltet.

4. Zusammensetzung nach Anspruch 3, wobei das Oniumsalz eine 50/50-Mischung aus

5. Für ultraviolettes Licht empfindliche Zusammensetzung, umfassend:

- 20
- A) ein kationisch polymerisierbares Material;
 - B) ein Oniumsalz in einer Menge, die ausreicht, um eine Polymerisation des kationisch polymerisierbaren Materials zu bewirken; und
 - C) ein Anthracenderivat, das durch folgende Formel dargestellt wird:

wobei X CH=CH₂ oder
 -(CH₂)_n O-(-R) ist, wobei R aus der Gruppe mit H,

ausgewählt wird, wobei jedes R^I, R^{II} und R^{III} individuell aus der Gruppe von Alkyl, Alkenyl, Aryl,

und

ausgewählt wird, wobei jedes R^N , R^V und R^M individuell aus der Gruppe von Alkyl, Alkenyl und Aryl ausgewählt wird; wobei m eine ganze Zahl zwischen 0 und 4, p eine ganze Zahl zwischen 0 und 4; und n eine ganze Zahl zwischen 1 und 2 ist;
und wobei das Gewichtsverhältnis von B:C etwa 1:2 bis etwa 1:10 beträgt.

6. Zusammensetzung nach Anspruch 5, wobei das Anthracenderivat aus der Gruppe mit 9-Anthracenmethanol; 9-Vinylanthracen; und dem Trimethylsiloxyether von 9-Anthracenmethanol ausgewählt wird.
7. Zusammensetzung nach den Ansprüchen 5 und 6, wobei das Oniumsalz Triphenylsulfoniumhexafluorantimonat beinhaltet.
8. Zusammensetzung nach Anspruch 7, wobei das Oniumsalz eine 50/50-Mischung von

ist.

9. Zusammensetzung nach Anspruch 5, wobei das kationisch polymerisierbare Material ein Epoxidpolymer oder ein Siliconpolymer ist.
10. Zusammensetzung nach den Ansprüchen 5 und 9, wobei das polymerisierbare Siliconpolymer durch folgende Formel dargestellt wird:

wobei x zwischen 1 und 100 liegt.

11. Zusammensetzung nach den Ansprüchen 5 und 9, wobei das Siliconpolymer durch folgende Formel dargestellt wird:

12. Verfahren zur Bildung einer Photoresiststruktur, das umfaßt:

A) Bereitstellen eines ungehärteten Films auf einem Substrat, bestehend aus:

- 1) einem kationisch polymerisierbaren Material;
- 2) einem Oniumsalz in einer Menge, die ausreicht, um eine Polymerisation des kationisch polymerisierbaren Materials zu bewirken; und
- 3) einem Anthracenderivat, das durch folgende Formel dargestellt wird:

wobei X CH=CH₂ oder

-(-CH₂)_nO-(-R) ist, wobei R aus der Gruppe mit H,

ausgewählt wird, wobei jedes R^I, R^{II} und R^{III} individuell aus der Gruppe von Alkyl, Alkenyl, Aryl,

und

5

10

ausgewählt wird, wobei jedes R^{IV} , R^V und R^{VI} individuell aus der Gruppe von Alkyl, Alkenyl und Aryl ausgewählt wird; wobei m eine ganze Zahl zwischen 0 und 4, p eine ganze Zahl zwischen 0 und 4; und n eine ganze Zahl zwischen 1 und 2 ist; und wobei das Gewichtsverhältnis von 2:3 etwa 1:2 bis etwa 1:10 beträgt;

15

B) bildweises Belichten des ungehärteten Films mit ultraviolettem Licht mit einer Struktur, um dadurch eine kationische Polymerisation des Films in der Struktur zu bewirken; und
C) Entwickeln des Photoresistes.

20

13. Verfahren nach Anspruch 12, wobei die Wellenlänge des ultravioletten Lichtes etwa 300 Nanometer bis etwa 400 Nanometer beträgt.

14. Verfahren nach Anspruch 12, wobei das kationisch polymerisierbare Material ein Epoxid- oder ein Silicopolymer ist.

25

15. Verfahren nach Anspruch 12, wobei die Strahlung diejenige eines Elektronenstrahls ist.

Revendications

30

1. Composition de photo-amorceur sensible à la lumière ultraviolette convenant pour des réactions de polymérisation cationique et comprenant :

A) au moins un dérivé d'anthracène représenté par la formule :

35

40

où X représente $CH=CH_2$ ou $-(CH_2)_n$ 0-(-R), où R est sélectionné dans le groupe H, et

45

50

où R^I , R^{II} et R^{III} sont sélectionnés individuellement dans le groupe alkyle, alcényle, aryle

55

et

où R^{IV} , R^V et R^{VI} sont sélectionnés individuellement dans le groupe alkyle, alcényle et aryle;
 où m est un nombre entier compris entre 0 et 4, p est un nombre entier compris entre 0 et 4, et n est
 un nombre entier égal à 1 ou 2;

B) un sel d'onium; et

C) un solvant organique, où le rapport de poids A:B est compris entre environ 1:2 et 1:10.

2. Composition selon la revendication 1, dans laquelle ledit dérivé d'anthracène est sélectionné dans le groupe 9-méthanol d'anthracène; 9-anthracène de vinyle; et éther triméthylsiloxyle de 9-méthanol d'anthracène.
3. Composition selon les revendications 1 et 2, dans laquelle ledit sel d'onium comprend de l'hexafluoroantimoniate de triphénylsulfonium.
4. Composition selon la revendication 3, dans laquelle ledit sel d'onium est un mélange 50/50 de

5. Composition sensible à la lumière ultraviolette comprenant :
 - A) un corps cationiquement polymérisable;
 - B) un sel d'onium en quantité suffisante pour induire la polymérisation du corps cationiquement polymérisable; et
 - C) un dérivé d'anthracène représenté par la formule :

10 où X représente $\text{CH}=\text{CH}_2$ ou $-(\text{CH}_2)_n\text{O}-(-\text{R})$, où R est sélectionné dans le groupe H, et

20 où R^{I} , R^{II} et R^{III} sont sélectionnés individuellement dans le groupe alkyle, alcényle, aryle

30 et

où R^{IV} , R^{V} et R^{VI} sont sélectionnés individuellement dans le groupe alkyle, alcényle et aryle; où m est un nombre entier compris entre 0 et 4, p est un nombre entier compris entre 0 et 4, et n est un nombre entier égal à 1 ou 2;

45 et où le rapport B:C est compris entre environ 1:2 et 1:10.

6. Composition selon la revendication 5, dans laquelle ledit dérivé d'anthracène est sélectionné dans le groupe 9-méthanol d'anthracène; 9-anthracène de vinyle; et éther triméthylsiloxyle de 9-méthanol d'anthracène.

- 50 7. Composition selon les revendications 5 et 6, dans laquelle ledit sel d'onium comprend de l'hexafluoroantimoniate de triphénylsulfonium.

8. Composition selon la revendication 7, dans laquelle ledit sel d'onium est un mélange 50/50 de

5

et

10

15 9. Composition selon la revendication 5, dans laquelle ledit corps cationiquement polymérisable est un polymère époxy ou un polymère silicone.

10. Composition selon les revendications 5 et 9, dans laquelle le dit polymère silicone polymérisable est représenté par la formule :

20

25

30

35

où x est compris entre 1 et 100.

11. Composition selon les revendications 5 et 9, dans laquelle ledit polymère silicone est représenté par la formule :

40

45

50

55

12. Procédé pour former un motif de photoresist comprenant les étapes consistant à :

A) déposer sur un substrat une couche non cuite composée

1) d'un corps polymérisable cationique;

2) d'un sel d'onium en quantité suffisante pour induire la polymérisation du dit corps polymérisable

cationique; et

3) d'un dérivé d'anthracène représenté par la formule :

où X représente $\text{CH}=\text{CH}_2$ ou $-(\text{CH}_2)_n\text{O}-(\text{R})$, où R est sélectionné dans le groupe H, et

où R^{I} , R^{II} et R^{III} sont sélectionnés individuellement dans le groupe alkyle, alcényle, aryle

et

où R^{IV} , R^{V} et R^{VI} sont sélectionnés individuellement dans le groupe alkyle, alcényle et aryle; où m est un nombre entier compris entre 0 et 4, p est un nombre entier compris entre 0 et 4, et n est un nombre entier égal à 1 ou 2; et où le rapport de poids 2:3< est compris entre environ entre 1:2 et 1:10.

B) exposer ladite couche non cuite à la lumière ultraviolette selon un motif pour induire la polymérisation cationique de ladite couche selon ledit motif; et

C) développer ledit photorésist.

- 50
13. Procédé selon la revendication 12, dans lequel la longueur d'onde de la lumière ultraviolette est comprise entre environ 300 et 400 nanomètres.
- 55
14. Procédé selon la revendication 12, dans lequel ledit corps polymérisable cationique est un polymère époxy ou silicone.
15. Procédé selon la revendication 12, dans lequel ledit rayonnement est un rayonnement par faisceau d'électrons.
